

OBJECTIVE

Computer Engineer in search of full-time employment. Available to begin work anytime. I am interested in finding a long-term role that matches my skillset so I can continue to raise my family for the foreseeable future.

EDUCATION

Bachelor of Science, Computer Engineering Rochester Institute of Technology, Rochester NY, Completed by December 2017

ENGINEERING WORK EXPERIENCE

Bank of New York - Pittsburgh, PA - VP Engineer, Dec 2024 to Present

- Worked with a team of seven (all overseas team members) to provide US timezone support for live trading services. Job duties included feature updates, bug fixes, and weekend release/testing support for 20+ production microservices.
- Worked on over 20 live production services in Java Spring, Angular, and Ruby on Rails. The services were deployed using AppEngine technologies, which were switching over to GitLab.
- Ruby on Rails services were actively being converted or completely rewritten to Java Spring services.
- Java services used as REST endpoints, routing management, message management, and data reference tools.
- Ruby on Rails and Java Spring code bases were tested using RSpec and JUnit, respectively.
- Working on Angular 12 front-end and upgrading the front-end applications to Angular 14, Angular 16, and most recently to Angular 18. Much time was spent upgrading packages for Angular, Material, CSS, Babel, and related tools.
- Java Spring back-end used for REST API and overnight data retrieval work. Apache POI was used for reading and writing documents for reporting. Java JMS was used for emailing and logging. Hibernate JPA ORM was used for services that were designated for heavy data management.
- Minor use of Python and CLI scripting for live production assistance with data and deployment scenarios.
- Git version management was used to manage code changes to GitLab repositories.
- Postgres and Oracle database technologies were used to store relational tables, views, and materialized views.
- Used Windsurf AI to generate 2400+ test files for entire project.
- Languages used: Java, Ruby, Python, Bash CLI, Typescript, CSS + HTML, SQL

Fidelity Investments - Charlotte, NC - Senior Software Engineer, Jan 2022 to Nov 2024

- I worked on a team of four colleagues on the company's change management system, sharpening my technical design and leadership skills, mentoring junior developers, and roadmapping future designs. Skills in full-stack web development (VueJS and Angular) reached a principal level.
- The change management system was originally built with VueJS, but after teams were reconsolidated, a new one was developed with Angular 14.
- Testing for VueJS and Angular front-end frameworks used Jest.
- Java Spring back-end used for REST API and overnight data retrieval work. Apache POI was used for reading and writing documents for reporting. Java JMS was used for emailing and logging. Hibernate JPA ORM was used for services that were designated for heavy data management.
- Used PostgREST in back-end to provide direct "SQL-like" fetching capabilities for the front-end. Developers did not need to create a new REST endpoint for every unique fetch.
- Minor use of Python and CLI scripting for live production assistance with data and deployment scenarios.

- Git version management was used to manage code changes to BitBucket repositories
- Postgres and Oracle database technologies were used to store relational tables, views, and materialized views.
- Generated embedded Power BI reports for change management analytics for the company.
- Languages: Typescript, Javascript, CSS + HTML, Java, Python, Bash CLI, Postgres and Oracle SQL

Integrated Practice Solutions (Chirotouch) - Las Vegas, NV - Software Engineer, Apr 2019 to Jan 2022

- Worked in a team of eight to twelve colleagues on a cloud-based solution for medical treatment in the Chiropractic field. I developed senior-level skills in full-stack web development and made technical and road-map decisions. I became versed in medical field terminology, legal knowledge, and design philosophy.
- Used the Google Lit framework for the front-end framework. Most of the work involved fixing bugs, writing new features for the application, and making major overhauls before product release.
- Created a custom web components package for the Google Lit framework and created a design pattern for the project to fix existing bugs and to provide a consistent and reliable pattern for junior developers to follow. The '@iron' packages were deprecated and replaced by the new web components library '@zen'.
- Back-end used ExpressJS and Oracle DB for REST API work. Mostly wrote CRUD-style endpoints and created new tables.
- Git version management was used to manage code changes to BitBucket repositories
- Languages: JavaScript, CSS + HTML, Python, SQL

Microsoft - Redmond, WA - Junior Software Engineer, Jan 2018 to Feb 2019

- Worked in a team of six people on front-end and back-end application development. Developing powerful skills in Web Development in Angular and back-end hosting tools such as Azure.
- Mentored heavily by the lead technical engineer on how to build a web app with Angular. I was given direct supervision in building a full-stack application from the front end to the back end.
- Implemented Material UI packages throughout the application and created design principles for the rest of the team to follow.
- Git version management was used to manage code changes to GitHub repositories
- Created PowerBI reports for embedding in our webapp. Met with management and collected data across the company chapter. Discussions led to major changes for the company for the security of data management.
- Languages: TypeScript, CSS + HTML, SQL

SKILLS

LANGUAGES:	Java, Javascript/Typescript, HTML5, CSS3, Python, Ruby, C#
TECHNOLOGIES:	Java Spring, Angular 6-19, Angular Electron, NodeJS, ReactJS, Vue, Next.js, ExpressJS, JUnit, Jest/Vitest, Oracle/PostgreSQL/MySQL, AWS/Azure, Git/Github/Gitlab/BitBucket, Full-Stack CI/CD technologies (Jenkins, Sonarqube, etc)
MISCELLANEOUS:	Git, GitHub, CI/CD, Jenkins, Gitlab, GitLab CI, Agile, Scrum, Node.js, Express, NestJS, REST APIs, GraphQL, Java, Java Spring, Spring Boot, JPA, JMS, Hibernate, Apache POI, C#, .NET, Python, PostgreSQL, MySQL, MongoDB, Scalability & load balancing, Redis, Docker, Kubernetes, Microservices & monoliths, Event-driven architectures, RabbitMQ, API design, Authentication & Authorization, OAuth2, JWT, Opaquetokens, OpenID Connect, Authentication, Authorization, SQL, NoSQL, Unit testing, Integration testing, Jest, Cypress, JUnit, PyTest, Webpack, Babel, ESLint, Prettier, Material CSS, TailwindCSS, Bootstrap, Material UI, System design, Monitoring, Logging, Microservices & monoliths, Caching strategies, Problem-solving & critical thinking
